

Usability Study Report – EsportsEdge

Authors: Raagini Tyagi, Rahul Nayak

Course: CS5610 – Web Development | Spring 2026

Instructor: John Guerra

Note to instructor: Recording evidence was provided in the Canvas submission for the usability study report.

Application Scope

Application Description

EsportsEdge is a web-based match tracking and statistics platform for casual and competitive esports players. Users can create and manage player profiles and game titles, log match results, browse and filter match history, and view computed statistics including win rate, total matches, and head-to-head comparisons between two players.

Users – Target Audience

Primary Persona – The Casual Gamer

- Age: 18–28
- Plays 2–5 hours of online games per week
- Interested in tracking personal progress but not affiliated with any competitive team
- Comfortable with basic web apps but not necessarily technical
- Wants a simple way to see how they're doing against friends

Secondary Persona – The Competitive Player / Team Manager

- Age: 18–30
- Plays regularly in organized matches or tournaments
- Needs to log match results quickly and review stats to inform strategy
- Values data accuracy and filtering capabilities
- Expects a clean, fast interface

Data Description

The application stores and displays:

- **Players:** Username, display name, and computed stats (total matches, wins, losses, win rate)
- **Games:** Game title and total match count
- **Matches:** Date, associated game, participating players, optional winner, and optional score

- **Head-to-head stats:** Total shared matches, wins per player, and draws — computed on demand from the matches collection

Main Tasks – Use Cases

- **T1:** Create a new player profile and verify it appears in the players list
 - **T2:** Log a new match between two existing players for an existing game
 - **T3:** Find a specific player's profile and review their win/loss statistics
 - **T4:** Use the head-to-head feature to compare two players
 - **T5:** Filter match history by game title or date
-

Experiment

Preparation

Introduction Script (read to each participant)

"Thank you for participating in this study. We're testing the usability of a web application called EsportsEdge — a platform for tracking esports match results and player stats. We want to understand how easy it is to use, so your honest reactions are very valuable.

A few things before we start: **You are not being evaluated** — the application is. There are no right or wrong answers. Please **think out loud** as you work through each task — just narrate what you're looking at, what you're trying to do, and how you feel about it.

Do you consent to being recorded (audio + screen) for research purposes?
The recording will only be used by the study authors.

You may stop or leave at any time without any consequence. Any questions before we begin?"

Demographics Questions

(Participants may refuse to answer any question.)

1. How old are you? (*range: under 18 / 18–24 / 25–34 / 35+*)
 2. How often do you play video games? (*Never / Occasionally / Weekly / Daily*)
 3. Have you ever used a stats tracking or sports management app before? (*Yes / No*)
 4. How would you rate your general comfort with web apps? (*1 = not comfortable, 5 = very comfortable*)
-

Recording Setup

- [] Screen recording software active (e.g., OBS, Zoom, Loom)
 - [] Audio recording confirmed
 - [] Camera on (optional, for facial expressions)
 - [] Browser opened to EsportsEdge homepage, logged out / fresh state
-

Task Scripts (read to participants)

Intuitiveness – Initial Approach

"I'm going to show you the application for the first time. Without clicking anything yet, take a look at the screen and tell me: What do you think this application does? What would you do first?"

T1 – Create a Player Profile

"Imagine you just started using EsportsEdge. Please create a new player profile for yourself using any username you like. When you're done, confirm that your profile appears in the players list."

T2 – Log a Match

"Two players — [Player A] and [Player B] — just finished a game of [Game Title]. Please log this match in the application. [Player A] won."

T3 – View Player Stats

"Please find the profile page for [Player A] and tell me how many matches they've won and what their win rate is."

T4 – Head-to-Head Comparison

"Using the application, find out how many times [Player A] and [Player B] have played against each other, and who has won more."

T5 – Filter Match History

"Go to the match history and show me only the matches played for [Game Title]."

Post-Test Questionnaire – Likert Scales

(1 = Strongly Disagree, 5 = Strongly Agree)

- | # | Question |
|----|---|
| 1 | The application was effective for completing T1 (creating a player). |
| 2 | T1 was intuitive and easy to complete. |
| 3 | The application was effective for completing T2 (logging a match). |
| 4 | T2 was intuitive and easy to complete. |
| 5 | The application was effective for completing T3 (viewing stats). |
| 6 | T3 was intuitive and easy to complete. |
| 7 | The application was effective for completing T4 (head-to-head). |
| 8 | T4 was intuitive and easy to complete. |
| 9 | The application was effective for completing T5 (filtering matches). |
| 10 | T5 was intuitive and easy to complete. |
| 11 | The application was effective overall. |
| 12 | The application was intuitive and easy to use overall. |
| 13 | Any final comments or suggestions for improvement? (<i>open text</i>) |
-

Rahul's Experiment Notes

Participant 1

Demographics Answers

- Age range: 25–34
- Gaming frequency: Daily
- Prior stats app experience: Yes (has used op.gg and tracker.gg)
- Web app comfort level: 5/5

Detailed Notes

- *Initial approach:*
 - Participant immediately understood the app's purpose from the home screen, describing it as "a stats tracker for esports, kind of a lite version of op.gg for any game" aimed at friend groups wanting a leaderboard
- *T1 (Create player):*
 - Found the Register page instantly via the top navigation
 - Commented that it was annoying not to be auto-logged in after registering and felt like an unnecessary extra step
 - Successfully logged in manually with the credentials just created
 - When looking for his own profile in the Players list, immediately noted the absence of a search bar and fell back to using ctrl+F to locate himself
 - Completed the task but flagged the scrolling experience as a clear pain point
- *T2 (Log match):*
 - Navigated to Matches and Add Match without hesitation
 - Appreciated that dropdowns supported typeahead ("I can type 'Val' and it filters") but disliked that the underlying dropdown options weren't ordered alphabetically
 - Flagged a clear UX issue: the Winner dropdown displays ALL players in the system rather than just the two players added to the match ("dropdown has every player not just the two I added, that's weird")
 - Did not initially expect that the user logging the match would need to manually add themselves as a participant, but figured it out quickly without a hint
 - Completed the task successfully
- *T3 (View stats):*
 - Went directly to the Players page and used ctrl+F to find Bob Marley's profile with no difficulty
 - Found the stats display on the profile page (total matches, wins, losses, win rate) clear and easy to read
 - Suggested two improvements for the profile page: a list of the player's recent matches, and a visual chart showing win rate over time ("right now it's just numbers")
- *T4 (Head-to-head):*
 - Navigated directly to the Head-to-Head page from the nav and had already seen it during free exploration

- *Used the typeahead selectors to pick both players and ran the comparison with no friction*
- *Result display was clear, but participant suggested adding a bar chart or pie chart to make the comparison more visually engaging*
- *T5 (Filter matches):*
 - *Found the filter dropdown at the top of the Matches page and filtered by "Artifact" with no issues*
 - *Almost missed the match count displayed at the top of the page because the font is too small ("the number is small, almost missed it")*
 - *Noticed the date filter is also present*
 - *Requested an additional "Filter by player" option and called it an obvious gap ("show me all the matches I've played")*

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	4	5	Register button was exactly where expected, but not being auto-logged in after registering is annoying.
T2	4	4	Form itself was clear once Add Match was located. The Winner dropdown showing every player instead of only the two added to the match looks like a real bug.
T3	3	5	Stats on the profile page are easy to read. Finding the player without a search bar is rough only worked because participant is tech-savvy enough to use ctrl+F.
T4	5	5	"Easiest task by far." Worked exactly as expected. Would be even better with a visual element (bar/pie chart).
T5	4	5	Dropdown filter was obvious and typeahead made selection fast. Would be a 5 with a Filter-by-Player option added.
Overall	4	4	Solid app overall but missing basic UX affordances like search bars. Suggestions: (1) add search bars across all list pages (Players,

Games, Matches); (2) restrict the Winner dropdown in Add Match to only include the players who were added to that match; (3) add visual elements to stats pages bar charts, win rate trend lines, or similar to make the app feel more "esports".

Participant 2

Demographics Answers

- Age range: 25–34
- Gaming frequency: Weekly
- Prior stats app experience: No
- Web app comfort level: 4/5

Detailed Notes

- *Initial approach:*
 - *Participant correctly inferred the general purpose of the app, describing it as "a system for keeping track of who played who, which game, who won like a record book for gaming"*
 - *Identified all four main nav sections during free exploration but with less confidence than the previous participant*
 - *Initially misinterpreted "Head-to-Head" as a page for logging one-vs-one matches rather than for comparing two players, and only realized its actual purpose after clicking into it*
 - *Flagged the missing search bar on the Players list almost immediately ("that's gonna be a problem if there are tons of players")*
 - *Identified the core user stories like register, create players, log matches, view stats, compare two players but expressed uncertainty about whether he had found everything*
- *T1 (Create player):*
 - *Found the Register page intuitively from the top nav and signed up without difficulty*
 - *Confused that registration didn't automatically log him in and said it felt like "an extra step for nothing"*
 - *Logged in manually with no issue*
 - *When asked to verify his profile in the Players list, scrolled through the entire list looking for himself and did not think to use ctrl+F*
 - *Explicitly asked for a search bar at the top of the Players list ("scrolling through that list is tedious")*
 - *Completed the task but with mild frustration*
- *T2 (Log match):*

- Navigated to the Matches page intuitively but spent around 20 seconds scanning before noticing the "Add Match" button at the top
- Selected the game using typeahead with no issue
- Hesitated and asked aloud whether the system would auto-add him as a player since he was the one logging the match and assumed it would, then realized it wouldn't and added himself manually
- Independently flagged the same Winner dropdown issue as Participant 1: the dropdown shows every player in the system rather than only the participants in the match ("Why? I'd want it to just be Bob and me since we're the only ones in the match")
- Successfully logged the match
- T3 (View stats):
 - Returned to the Players page and used ctrl+F to find Bob Marley after scrolling for a few seconds
 - Found the profile page and stats display "really clear" and easy to read
 - Made a particularly insightful comment that the profile page itself is great but getting there is painful without a search bar and noted that he only thought of ctrl+F because he is "a little tech-savvy" and that "a casual user would just give up"
- T4 (Head-to-head):
 - Navigated to the Head-to-Head page and used the typeahead selectors to compare himself and Bob Marley with no friction
 - Worked smoothly once he was on the page, but reiterated that the page name had confused him initially
 - Suggested renaming the page or adding a subtitle such as "Compare Two Players" to clarify its purpose
- T5 (Filter matches):
 - Found the filter dropdown at the top of the Matches page without difficulty and filtered by "Chess"
 - Did NOT notice the match count displayed at the top of the page until the moderator prompted him and confirmed the count is too small
 - Did not notice or use the date filter

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	3	4	Register button was where he expected. Combination of no auto-login and tedious player list scrolling brought the effectiveness score down.
T2	3	3	Several confusing moments like looking for Add Match button, unsure whether to add himself as a player, and the Winner

			dropdown showing all players instead of just the two in the match.
T3	3	4	Profile page itself is great. Getting to it is painful without a search and relied on ctrl+F, which a casual user would not think of.
T4	5	3	Page worked perfectly once on it, but the Head-to-Head label was confusing initially. Suggested clearer naming or a subtitle.
T5	4	4	Filter was visible and easy to use. Match count font is too small and missed it the first time.
Overall	3.5	3	The app is functional but needs polish for labels, search, and the post-registration flow are the main concerns. Suggestions: (1) add a search bar to the Players list; (2) clarify the "Head-to-Head" label with a subtitle like "Compare Two Players"; (3) auto-include the user logging a match as a participant by default; (4) restrict the Winner dropdown to match participants only.

Participant 3

Demographics Answers

- Age range: 25–34
- Gaming frequency: Occasionally
- Prior stats app experience: No
- Web app comfort level: 3/5

Detailed Notes

- *Initial approach:*
 - *Participant identified that the app was related to esports but expressed unfamiliarity with the term, describing it tentatively as something that "tracks who plays what" in competitive video games*
 - *Stated upfront that they probably weren't the target user "people who play games seriously, not someone like me"*

- *Could not confidently say what tasks were possible on the site without clicking "I'd have to click around"*
- *During free exploration, identified the read-only views (player list, profile, matches list, comparison page) but did not naturally discover the create/edit actions on the site*
- *The "Head-to-Head" label was unfamiliar and unclear only understood it after navigating to the page and seeing the comparison interface*
- **T1 (Create player):**
 - *Found the Register page from the top nav and registered successfully*
 - *Confused that registration didn't auto-log him in said "That's confusing" when redirected to the login page*
 - *When asked to verify her profile in the Players list, scrolled through the entire list and did NOT think to use ctrl+F at any point*
 - *Said aloud at one point that an inexperienced user would "probably give up" trying to find themselves in the list*
 - *Eventually located his profile after extensive scrolling*
 - *Took noticeably longer than the other two participants to complete this task; provides strong evidence that a search bar is critical for less tech-savvy users*
- **T2 (Log match):**
 - *Went to the Matches page intuitively but did not see the "Add Match" button immediately and scrolled past it before realizing it was at the top*
 - *When picking a game from the dropdown, initially scrolled before realizing he could type to filter*
 - *Confused about whether to add himself as a player when logging the match defaulted to adding himself but expressed uncertainty*
 - *Independently flagged the Winner dropdown issue, asking why it shows everyone in the system rather than just the two players in the match and this is now the third participant to flag this exact issue*
 - *Skipped the optional score field*
 - *Successfully logged the match but with multiple moments of doubt throughout*
- **T3 (View stats):**
 - *Returned to the Players page and scrolled to find Bob Marley explicitly said "I really wish there was a search"*
 - *Did not use ctrl+F at all*
 - *Found the profile page itself "easy to read" once he got there*
 - *Explicitly noted that the players list is not in alphabetical order, which made the scrolling experience even worse*
- **T4 (Head-to-head):**
 - *Navigated to the Head-to-Head page and used the typeahead selectors to compare himself and Bob with no difficulty*
 - *Identified Head-to-Head as the easiest task of the session*
 - *Said the typeahead in the dropdowns made up for the lack of an alphabetical or searchable underlying list*
- **T5 (Filter matches):**
 - *Found the filter dropdown without help and filtered by "Chess"*
 - *Started counting the filtered matches manually until prompted to look for the count in the UI*

- *Once shown, said the count "should be bigger" and confirms the small-font issue raised by both Participant 1 and Participant 2*
- *Did not notice the date filter*

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	2	3	Registering was fine but locating own profile required excessive scrolling. Said an average user would give up.
T2	3	2	Multiple moments of doubt throughout like Add Match button hard to spot, unclear whether to add himself as a player, and Winner dropdown confusing.
T3	2	4	Profile page is great; getting there is painful without a search bar, especially since the list isn't alphabetical.
T4	5	5	Easiest task. Typeahead in the player selectors worked very well.
T5	4	4	Filter easy to find. Match count text in the UI is too small.
Overall	3	3	Core flows work, but onboarding and discoverability hurt first-time users badly. Suggestions: (1) add a search bar everywhere there's a list; (2) auto-login users after they register and don't make them log in again immediately; (3) when logging a match, include the logged-in user as a participant by default with the option to remove themselves; (4) restrict the Winner dropdown to only the players in the match; (5) make the match count text on the filter page bigger or use color so it stands out.

Raagini's Experiment Notes

Participant 1

Demographics Answers

- Age range: 25–34
- Gaming frequency: Daily
- Prior stats app experience: Yes
- Web app comfort level: 5/5

Detailed Notes

- *Initial approach:*
 - Participants immediately was able to tell what the app is for (track players' data/stats from games) and all the things that can be done on the app
- *T1 (Create player):*
 - *Navigated to the Register page right away and registered*
 - *Understood that he'll need to login to edit player profile but conveyed that it would be nice if it logged him in automatically after he registered instead of it being another separate step*
 - *User struggled to login with the first account he created as evidenced by him trying different username and password combinations with different case-sensitivity - please note, this is a user error and not an issue with the application itself*
 - *User was not able to login with the first account - "I don't know... I have to make a new one" so he created so he created a new account on the register page and successfully logged in with that one*
 - *Was able to edit his profile with no issues*
 - *When finding his profile in the players list, he went to the correct page right away and started scrolling. The players list is long so user did ctrl+f and found it that way.*
 - *Commented that you can delete other players' profiles*
- *T2 (Log match):*
 - *After previous task, user had to scroll up for a long time to get back to the navigation bar*
 - *Looked at both Game and Match pages to see where to log a match but figured it out quickly*
 - *When adding players, noted that it wasn't ordered alphabetically and there was no search - dropdown for player selection was frustrating*
 - *User wasn't able to find the player he was looking for - researcher had to give a hint and then player was able to find it by typing in the first few letter of the player's name in the dropdown box*
- *T3 (View stats):*
 - *Found profile page and player stats for 'Bob Marley' immediately*
- *T4 (Head-to-head):*
 - *Did task quickly with no issues*
- *T5 (Filter matches):*

- *Tried scrolling to find game name at first but as the Game list was not ordered, participant typed in the first few letters of the game name to find it*
- *When asked how many matches there were for that particular game, the participant said “I have to count?” and then counted 5 but afterwards noticed that the count is shown in the UI next to the word “Matches” at the top of the page - font size might be too small for users to notice*

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	3	4	
T2	4	5	
T3	2	5	There’s no in-built search bar to find a player’s name (only scrolling) or you have to do ctrl+f
T4	4	4	
T5	5	5	
Overall	2-3	4	Only admins should be allowed to delete player profiles, and edit games. When creating a profile, it should auto-log me in. It would be nice to see matches per game on your own profile rather than just the overall number of matches. I would like to filter games by category/genre. The app was intuitive overall, it just needs some adjustments (particularly search bars).

Participant 2

Demographics Answers

- Age range: 25–34
- Gaming frequency: Occasionally
- Prior stats app experience: No
- Web app comfort level: 4/5

Detailed Notes

- *Initial approach:*
 - *Can tell it's for gaming, tracking matches and stats. Thought it might be a game.*
- *T1 (Create player):*
 - *Found Register page right away, signed up and created an account*
 - *Said it was obvious that she needed to login after creating an account, navigated to login page and logged in with no issues*
 - *When prompted to edit her bio on her player profile, the participant seemed confused about where to go at first. The participant initially navigated to the Games page to try to complete that task but could not figure out what to do. With a hint from the researcher, the participant realized she's not on the right page for this task and was able to go to her profile and edit her bio easily.*
 - *Finding her user profile on the players list was difficult for the participant - there was a lot of scrolling involved and she said that there is no search bar.*
 - *"It would be nice to have a search bar"*
 - *Was able to find herself in the players list after using keyboard shortcut ctrl+f*
- *T2 (Log match):*
 - *Intuitively went to the Matches page for logging a match but it seemed like participant did not notice the "Add match" button and tried to filter matches by game*
 - *Researcher probed participant - participant went to home page then the Games page, then the Head-to-Head page to see if she could add a match and wasn't able to figure it out*
 - *Researcher confirmed that adding a match has to be done on the Matches page.*
 - *The participant eventually found the "Add match" button after some browsing on the Matches page.*
 - *Selecting players while adding a match was not straightforward - participant had to scroll amongst unordered names and eventually just typed in "Bob" and was able to find "Bob Marley" in the player list.*
 - *It was not immediately clear to the participant that they needed to add themselves to the list of players when logging a match; they appeared to assume that the user creating the match would be automatically included - this piece was clarified by the researcher.*
 - *She was able to log the match successfully.*
- *T3 (View stats):*
 - *Intuitively went to the Players page and quickly found the player profile with ctrl+f and identified the player stats immediately.*
- *T4 (Head-to-head):*
 - *Navigated to the correct page right away, put in the correct player names and found the head-to-head stats with no difficulties.*
- *T5 (Filter matches):*
 - *Navigated directly to the Matches page and quickly filtered results to display only matches for the requested game, "Artifact".*
 - *When asked how many matches existed for "Artifact," the participant counted them manually and did not notice the count already displayed in the UI.*

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	4-5	5	
T2	3	3	Logging a match was confusing and she said she was trying to figure out how to use this new app
T3	3	4	She said she had to figure out that she can do ctrl+f but “It would be nice to have a search bar”
T4	4	5	“That was very straightforward”
T5	3.5	4	She said she got the hang of it by then but again, there’s no search bar which would be nice and inclusive.
Overall	3.5	4	It could be more inclusive but she found the website simple to navigate and pretty intuitive. Suggestions were to make the design more inclusive with search bars and maybe use of color, and maybe a simple guide/tutorial for those with accessibility needs.

Participant 3

Demographics Answers

- Age range: 25–34
- Gaming frequency: Occasionally
- Prior stats app experience: No
- Web app comfort level: 5/5

Detailed Notes

- *Initial approach:*
 - *Participant was able to figure out the purpose and intent of the web app right away based on the home screen - logging and tracking esports matches and maintaining stats between players*
- *T1 (Create player):*
 - *Participant found it intuitive to go to the Register page and create a new account and login although he said he would've found it easier to be auto-logged in after registering*
 - *Was easily able to locate edit button and edit his bio after logging in*
 - *Noticed Players page tab is highlighted while he was on the My Profile page which was a bit confusing*
 - *When trying to search for his profile in the Players list, he asked if there is an easier way to do this and noticed that the players list is not in alphabetical order which would have been helpful*
- *T2 (Log match):*
 - *Initially went to the Matches page and then seemed unsure and went to the Head-to-Head page and back to Matches then went back and forth between the Matches and Players page. Asked why he gets to add players on the Players page and wondered when he would ever need to do that.*
 - *The participant thought he thought Head-to-Head might mean he can log a 1vs1 match there.*
 - *Was able to figure out where to log the match and clicked the "Add match" button*
 - *When entering match information, he initially was scrolling to find the game "Chess" but quickly figured out that he could just type the first few letters and it will show up*
 - *Said it would've been nice if the player list while logging matches was in alphabetical order but he likes that he can start typing and it will show up.*
 - *The participant noted that the Winner field should be constrained to the players involved in the match. For example, if only they and Bob Marley are listed as participants, the dropdown should display only those two names, even though the field is optional.*
 - *The participant assumed that, as the user logging the match, they would be automatically included as a player and were surprised that they needed to add themselves to the players list.*
 - *Was able to complete task successfully*
- *T3 (View stats):*
 - *Intuitively went straight to the Players page, did ctrl+f, and found Bob Marley's profile and player stats with no issues*
- *T4 (Head-to-head):*
 - *Went straight to the Head-to-Head page because he had explored that earlier and knew he would be able to do this task there*
 - *Found both players really quickly using the type and select function, and found 1vs1 stats*
- *T5 (Filter matches):*

- *Went to the Games page, did ctrl+f to find game name “Artifact” then clicked on it which redirected him to the Matches page for that specific game*
- *When asked how many matches there are for this game, he counted them manually and said 5 but later noticed that the count is mentioned in the UI as well but he said it’s tiny and could have been bigger.*
- *Participant wanted to find out which game had the most matches so he played around with the filters on the Matches page and noticed that the exact date filter doesn’t work as intended (possibly due to timezone issues)*

Post-Test Questionnaire Results

Task	Effectiveness (1–5)	Ease/Intuitiveness (1–5)	Notes
T1	3	5	He found it really intuitive to register and login. It was inconvenient to login again.
T2	4	3	The “Head-to-Head” wording was somewhat misleading, as the participant initially expected it to be the page for logging a match. However, once clarified, they were able to locate the “Add Match” button on the Matches page without difficulty. Adding players was not intuitive, and they did not expect to need to add themselves as a player when they were the one logging the match. Some instructions on how to add players would be helpful (including telling players that they need to add themselves if they took part in the match).
T3	1	5	Very straightforward to know where to go but effectiveness was poor because he had to scroll too much and even though

			he could do a browser search it would've been nice to not have to rely on the browser and have a search bar instead.
T4	5	5	He said he knew exactly where to go and that searching was easy.
T5	3	5	Intuitive but searchability could have been improved if game names were in alphabetical order or he could search by name.
Overall	3	5	The participant suggested incorporating visual elements for statistics (e.g., charts or graphs) and enabling sorting features, such as ordering games by number of matches and players by win rate. They also noted that the match count in the UI could be more prominent (e.g., larger size or distinct color). Additionally, the "View" button on the Players page was not immediately clear; they expected it might expand details in place rather than redirect. They suggested keeping expansion on the same page, while using the player's username as the link to the full profile.

Prioritized Issues & Proposed Changes

1. Lack of Search Functionality

Issue:

Users were unable to easily locate players, games, or matches due to the absence of search functionality. This led to excessive scrolling and reliance on browser shortcuts like Ctrl+F.

Change:

Add search bars across:

- Players page
- Games page
- Matches page
- Dropdowns (player/game selection)

Priority: Must

Was it implemented? How?

Not yet implemented.

2. Confusing Match Logging Flow

Issue:

Users struggled to determine where and how to log a match. The “Head-to-Head” label was misleading, and the “Add Match” button was not immediately visible.

Change:

- Make “Add Match” button more prominent
- Add clearer labeling or instructional text on the Matches page
- Consider renaming or clarifying “Head-to-Head”

Priority: Must

Was it implemented? How?

Partially implemented. The “Add Match” button visibility was improved through UI adjustments (placement and styling). Further labeling improvements are planned.

3. Poor Dropdown Usability (Players & Games)

Issue:

Dropdown lists were not alphabetically ordered, making it difficult to find players or games. Users experienced frustration when selecting participants for matches.

Change:

- Sort dropdown items alphabetically
- Enable type-to-search within dropdowns
- Improve selection UX for faster navigation

Priority: Must

Was it implemented? How?

Partially implemented. Type-to-search functionality exists, but alphabetical sorting and overall UX improvements are still pending.

4. Missing System Intelligence (User Expectations)

Issue:

Users expected automatic login after registration and automatic inclusion of themselves when logging a match. The absence of these behaviors caused confusion and extra steps.

Change:

- Auto-login users after registration
- Auto-add logged-in user as a participant when creating a match

Priority: Should

Was it implemented? How?

Not yet implemented. Requires backend session handling and frontend logic updates to pre-fill match data.

5. Lack of Data Visibility (UI Hierarchy Issues)

Issue:

Important information (e.g., match count) was present but not noticeable due to small font size and weak visual hierarchy. Users manually counted results instead.

Change:

- Increase font size and prominence of key metrics
- Use visual emphasis (color, placement, hierarchy)

Priority: Should

Was it implemented? How?

Not yet implemented. Identified as a UI refinement task for improving information visibility.

6. Inefficient Navigation for Large Lists

Issue:

Players and games were not sorted or easily browsable, making navigation inefficient, especially as data grows.

Change:

- Sort lists alphabetically by default
- Add optional sorting (e.g., by match count, win rate)

Priority: Should

Was it implemented? How?

Not yet implemented. Planned as an enhancement alongside search functionality.

7. Lack of Access Control (Permissions Issue)

Issue:

Users were able to delete or edit other players' profiles, raising concerns about data integrity.

Change:

- Restrict edit/delete actions to:
 - Profile owners
 - Admin users

Priority: Could

Was it implemented? How?

Not yet implemented.

8. Limited Feedback & Guidance for New Users

Issue:

Some users were unsure how to perform certain actions (e.g., logging matches, adding players).

Change:

- Add tooltips or inline instructions
- Consider a simple onboarding guide/tutorial

Priority: Would

Was it implemented? How?

Not yet implemented. Identified as a future usability enhancement.
